This study utilized Computational Fluid Dynamics (CFD) simulation to analyse the thermal performance of a containerized battery energy storage system, obtaining airflow organization and battery surface temperature distribution. What is the optimal design method of lithium-ion batteries for container storage? (5) The optimized battery pack structure is obtained, where the maximum cell surface temperature is 297.51 K, and the maximum surface temperature of the DC-DC converter is 339.93 K. The above results provide an Batteries operate optimally within specific temperature ranges. Excessive heat can lead to reduced efficiency, accelerated degradation, and even catastrophic failures such as thermal runaway. Conversely, too low a temperature can hinder performance and reduce the battery's ability to deliver power. The battery system is graded into cells, battery packs, battery clusters, and battery compartments. It uses lithium iron phosphate cells (3.2V/280Ah). 52 cells are connected in series to form a battery pack (1P52S). 8 battery packs are connected in series to form a battery pack. 8 battery clusters Containerized Battery Energy Storage Systems (BESS) are essentially large batteries housed within storage containers. These systems are designed to store energy from renewable sources or the grid and release it when required. This setup offers a modular and scalable solution to energy storage. BESS Effective heat dissipation is arguably the most critical aspect of container battery energy storage system design. Batteries generate heat during charging and discharging cycles, and excessive temperatures accelerate degradation and pose severe safety risks.
