

High-power solar power generation for home use

A solar generator is essentially a large rechargeable battery that powers electronic devices. The fastest way to charge it is by plugging it into a wall outlet, similar to charging a phone or computer. However, solar generators can also be charged using solar panels, making them invaluable during extended power outages when plug-in charging isn't available. Similar to gas vs. electric cars, gas generators are a reliable, well-established option with a wide variety of models available. Solar generators, while offering many benefits, are newer and come with some learning curves and challenges. When deciding between a solar and gas generator, consider your power needs and budget. For lower power needs, large whole-house generators can be integrated with rooftop solar panels, functioning similarly to a battery backup system like the Tesla Powerwall, storing energy until it's needed. Solar generators of all sizes can also be charged with portable solar panels, which connect to the battery via a standard solar cable. These panels typically range from \$100 to \$1,000. Since this is still an emerging category, the industry is still figuring some things out -- including what to call this new type of generator. It's also worth noting that the market for solar-powered generators is now splitting into "portable" and "whole-house" categories, similar to how gas generators come in either portable or standby models.
