

## How much battery is available for on-site energy

How many MW is battery energy storage? In 2019, only 4 megawatts (MW) of utility-scale battery energy storage was added in the United States. In July 2020, more than 20.7 GW of battery energy storage capacity was available in the United States. Battery energy storage systems provide electricity to the power grid and offer a range of services to support electric power grids. How much battery storage will the United States use in 2021? As of October 2020, 7.8 GW of utility-scale battery storage was operating in the United States; developers and power plant operators expect to be using 1.4 GW more battery capacity by the end of the year. From 2020 to 2021, they expect to add another 20.8 GW of battery storage capacity. Are utility-scale battery energy storage systems a source of electric power? Utility-scale battery energy storage systems have been growing quickly as a source of electric power capacity in the United States in recent years. In the first seven months of 2020, operators added 5 gigawatts (GW) of capacity to the U.S. electric power grid, according to data in our July electric generator inventory. Are battery storage systems a primary electricity source? Battery storage systems are not a primary electricity source, meaning the technology does not create electricity from a fuel or natural resource. Instead, batteries store electricity that has already been created from an electricity generator or the electric power grid, which makes energy storage systems secondary sources of electricity. Will Power Plants increase battery storage capacity in 2021? Developers and power plant owners plan to significantly increase utility-scale battery storage capacity in the United States over the next three years, reaching 30.0 gigawatts (GW) by the end of 2022, based on our latest Preliminary Monthly Electric Generator Inventory. Will battery storage set a record in 2020? In 2020, capacity growth from battery storage could set a record as operators report plans to add 19.6 GW of utility-scale battery storage to the grid, according to our January preliminary electric generator inventory data. Even though battery storage capacity is growing fast, in 2020 it was only 2% of the 1,230 GW of utility-scale electricity generating capacity in the United States. In the United States, cumulative utility-scale battery storage capacity exceeded 26 gigawatts (GW) in 2020, according to our January Preliminary Monthly Electric Generator Inventory. Generators added 10.4 GW of new battery storage capacity in 2020, the second-largest generating capacity. In this work we describe the development of cost and performance projections for utility-scale lithium-ion battery systems, with a focus on 4-hour duration systems. The projections are developed from an analysis of recent publications that include utility-scale storage costs. The suite of The U.S. Department of Energy's (DOE) Onsite Energy Technical Assistance Partnerships (TAPs) help American industrial and other large energy users lower costs, install onsite energy technologies, and increase resilience, security and energy independence. What Is Onsite Energy? Onsite energy refers to energy generated and used at the same location. In the first seven months of 2020, operators added 5 gigawatts (GW) of capacity to the U.S. electric power grid, according to data in our July electric generator inventory.
