

# Microgrid Energy Storage Power Station Project Price Introduction

How much does energy storage cost a microgrid? In commercial/industrial and utility microgrids, soft costs (43% and 24%, respectively) represent significant portion of the total costs per megawatt. Finally, energy storage contributes significantly to the total cost of commercial and community microgrids, which have percentages of 25% and 15%, respectively, of the total costs per megawatt. What is a microgrid cost model? The U.S. Department of Energy commissioned the National Renewable Energy Laboratory to complete a microgrid cost study and develop a microgrid cost model. The goal is to elucidate the variables that have the highest impact on costs as well as potential areas for cost reduction. This study consists of two phases. How much does a microgrid cost per megawatt? The analysis of total microgrid costs per megawatt shows that the community microgrid market has the lowest mean, at \$2.1 million/MW of DERs installed; followed by the utility and campus markets, which have mean costs of \$2.6 million/MW and \$3.3 million/MW, respectively. Finally, the commercial market has the highest average cost, at \$4 million/MW. Can microgrid cost information be collected? Despite the relative novelty of the microgrid market and the challenges faced when discussing microgrid costs, it is a very useful exercise to collect cost information from the microgrid community and better understand component costs and differences from one project to another. The principal goal in Phase I of the study was to collect data. What are the components of a microgrid? They can be used to power individual homes, small communities, or entire neighborhoods, and can be customized to meet specific energy requirements. Microgrids typically consist of four main components: energy generation, energy storage, loads and energy management. The architecture of microgrid is given in Figure 1. What is a utility microgrid? For utility microgrids, existing PV projects are in the form of DERs with the highest capacity, followed by new natural gas, diesel generators, and energy storage. Note that this group has only five entries in the database, and one of them integrates an existing, large PV project under a power purchase agreement.
