Components of RFBs RFB is the battery system in which all the electroactive materials are dissolved in a liquid electrolyte. A typical RFB consists of energy storage tanks, stack of electrochemical cells and flow system. The fundamental operation and structure of these batteries revolve around the flow of an electrolyte, which facilitates energy conversion and storage. Notably, the power and energy capacities can be independently designed, allowing for the conversion of chemical energy from input fuel into ed network. Flow batteries (FB) store chemical energy and generate electricity by a redox reaction between vanadium ions dissolved in the e ectrolytes. FB are essentially comprised of two key elements (Fig. 1): the cell stacks, where chemical energy is converted to electricity in a reversible Components of RFBs RFB is the battery system in which all the electroactive materials are dissolved in a liquid electrolyte.
