

# The world's superconducting magnetic energy storage system

Superconducting magnetic energy storage (SMES) systems store energy in the magnetic field created by the flow of direct current in a superconducting coil that has been cryogenically cooled to a temperature below its superconducting critical temperature. This use of superconducting coils to store magnetic energy was invented by M. Ferrier in . A typical SMES system includes three parts: Specific energy 4-40 kJ/kg; Energy density less than 40 kJ/L; Specific power ~10000-100000 kW/kg; Charge/discharge efficiency 95%. Watch full video.

**Advantages over other energy storage methods**

There are several reasons for using superconducting magnetic energy storage instead of other energy storage methods. The most important advantage of SMES is that the time delay during charge and discharge is minimal.
